

Vaccination options for your dog

Dangerous infectious diseases that could affect your dog

	Annual	Annual	Triennial
<p>Canine Parvovirus</p> <p>Affects dogs of all ages but is more serious in young pups and older dogs. The virus attacks the intestines causing blood stained diarrhoea, uncontrollable vomiting and severe abdominal pain. Dogs will often die from severe dehydration despite intensive veterinary care.</p>	✓		✓
<p>Canine Distemper</p> <p>A highly contagious viral disease that can affect dogs of any age with young puppies being at highest risk. Symptoms vary but can include fever, coughing, sneezing, nasal discharge, vomiting, diarrhoea, loss of appetite and depression. Dogs that do recover may have permanent brain damage.</p>	✓	OR	✓
<p>Canine Hepatitis</p> <p>A viral disease, which, like distemper, is extremely contagious and often fatal. Dogs of any age can become infected. Dogs that recover may develop long term liver and kidney problems and can act as carriers spreading the disease to other dogs for many months.</p>	✓		✓
<p>Canine Cough</p> <p>Canine cough is a condition produced by several highly infectious agents, which can be easily spread wherever dogs congregate, such as shows, obedience schools and boarding kennels. Affected dogs have a dry hacking cough known to persist for several weeks. It is distressing for dogs and their owners and can disturb neighbours.</p>	✓
